

std::true_type

```
graph BT; A["std::math::detail::  
is_extents< experimental  
::extents< size_type, Extents... > >"] --> B["std::true_type"]
```

The diagram illustrates an inheritance relationship. At the bottom is a large gray rectangle representing the base class `std::math::detail::is_extents< experimental::extents< size_type, Extents... > >`. It is divided into three horizontal sections, with the top section containing the class name. Above this rectangle is a smaller white rectangle representing the derived class `std::true_type`, also divided into three horizontal sections. A blue arrow points from the top edge of the gray rectangle to the bottom edge of the white rectangle, indicating that `std::true_type` inherits from `std::math::detail::is_extents< experimental::extents< size_type, Extents... > >`.

std::math::detail::
is_extents< experimental
::extents< size_type, Extents... > >
